NWS Windshield Chart

WIND CHILL EFFECT: The wind chill temperature is how cold people feel when outside. Wind chill is based on the rate of heat loss from exposed skin caused by wind and cold. As the wind increases, it drags heat from the body, thereby raising skin temperature and eventually the internal body temperature. Therefore, the wind chill makes the temperature feel colder than if there were no wind (75°F), even if the air temperature was (75°F). The temperature is in Degree Fahrenheit and the Wind Chill in Degrees, the wind chill in 15 degree increments. At 5 knots wind chill temperature, exposed skin can freeze in 20-30 minutes. The wind chill effect will be felt by objects, such as car windows, inside windows, etc., over time. The amount of time for the object to cool. The object will not cool below the actual air temperature. Be sure to have a National Weather Service guide for wind chill. Please keep this chart handy to help you plan your day when the weather gets bad.
